"The long, fine root system of **Fortuniana** is an ideal rootstock for sandy soils. The extensive fine roots enable the plant to absorb the nutrients and water it needs to produce food for growth. The more vigorous a root system, the more food it can transfer to the plant. The more food it can transfer to the plant, the faster it grows. Hence, the rose grows faster and the sizes of the flowers are also greatly increased. As an added bonus, the roots of Fortuniana are very resistant to the many varieties of nematodes found in our sandy soils.

"Fortuniana is not only more resistant to nematodes, but also to gall, stem die-back, and root diseases such as *Pythium*, *Phytophtora* and *Rhyzoctonia*. No other rootstock in all the world can compare with the qualities found in *Rosa fortuniana*. It will also live and produce decades longer than any other rootstock." *—Sandie Wick, Consulting Rosarian, Juniper, Florida*

Note: In the Middle Tennessee area (climate zone 6) Fortuniana root stock roses require winter protection, especially during the first couple of years of growth until the plants are acclimated to the area.
